26.Question : Linear Regression for Housing Price Prediction

```
import pandas as pd
```

```
from sklearn.model_selection import train_test_split
```

```
from sklearn.linear_model import LinearRegression
```

```
# Load dataset
```

```
data = pd.read_csv("housing.csv")
```

```
# Features and target
```

```
X = data[['Area', 'Bedrooms', 'Location']]
```

```
y = data['Price']
```

```
# Split data
```

```
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

```
# Train model
```

```
model = LinearRegression()
```

```
model.fit(X_train, y_train)
```

```
# User input
```

```
area = float(input("Enter house area: "))
```

```
bedrooms = int(input("Enter number of bedrooms: "))
```

```
location = int(input("Enter location code: "))
```

```
# Prediction
```

```
new_house = [[area, bedrooms, location]]
```

```
predicted_price = model.predict(new_house)
```

```
print("Predicted House Price:", predicted_price[0])
```

OUTPUT:

```
|
... Enter house area (sq ft): 1000
    Enter number of bedrooms: 3
    Enter location code: 1
    Predicted House Price: 3613333
```

27.Question: Logistic Regression for Customer Churn Prediction

```
import pandas as pd
```

```
from sklearn.model_selection import train_test_split
```

```
from sklearn.linear_model import LogisticRegression
```

```
# Load dataset
```

```
data = pd.read_csv("customer_churn.csv")
```

```
# Features and target
```

```
X = data[['UsageMinutes', 'ContractDuration']]
```

```
y = data['Churn'] # 0 = Not Churned, 1 = Churned
```

```
# Split data
```

```
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

```
# Train model
```

```
model = LogisticRegression()
```

```
model.fit(X_train, y_train)
```

```
# User input
```

```
usage = float(input("Enter usage minutes: "))
```

```
contract = int(input("Enter contract duration (months): "))
```

```
# Prediction
```

```
new_customer = [[usage, contract]]
```

```
prediction = model.predict(new_customer)
```

```
if prediction[0] == 1:
```

```
    print("Customer will churn")
```

```
else:
```

```
    print("Customer will not churn")
```

33. Scenario: You work as a data scientist for an automobile company that sells various car models.

```
import pandas as pd
```

```
from sklearn.linear_model import LinearRegression
```

```
from sklearn.metrics import mean_squared_error, r2_score
```

```
# Load dataset
```

```
data = pd.read_csv("car_data.csv")
```

```
# Select features and target
```

```
X = data[['EngineSize', 'Horsepower', 'FuelEfficiency']]
```

```
y = data['Price']
```

```
# Train Linear Regression model
```

```
model = LinearRegression()
```

```
model.fit(X, y)
```

```
# Predict prices
```

```
y_pred = model.predict(X)
```

```
# Model evaluation
```

```
mse = mean_squared_error(y, y_pred)
```

```
r2 = r2_score(y, y_pred)
```

```

print("Mean Squared Error:", mse)

print("R-squared Score:", r2)

# Feature importance (coefficients)
coefficients = pd.DataFrame({
    'Feature': X.columns,
    'Impact': model.coef_
})

print("\nInfluential factors affecting car prices:")

print(coefficients)

```

OUTPUT:

```

Accuracy: 0.96

```

21 write a Python program that allows the user to input the sample size, confidence level, and desired level of precision.

```

import numpy as np

import pandas as pd

from scipy.stats import norm

data = pd.read_csv("rare_elements.csv", header=None)[0].values

n = int(input("Sample size: "))

cl = float(input("Confidence level: "))

sample = np.random.choice(data, n, replace=False)

mean = np.mean(sample)

std = np.std(sample, ddof=1)

z = norm.ppf((1 + cl) / 2)

me = z * std / np.sqrt(n)

print("Mean:", mean)

print("Confidence Interval:", (mean - me, mean + me))

```

... Average Rating: 4.15
95% Confidence Interval: (np.float64(3.8234253105565887), np.float64(4.476574689443412))

`from sklearn.datasets import load_iris`
`iris = load_iris()`
`X, y = iris.data, iris.target`
`X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.3, random_state=42)`
`from sklearn.neighbors import KNeighborsClassifier`
`knn = KNeighborsClassifier(n_neighbors=3)`
`knn.fit(X_train, y_train)`
`y_pred = knn.predict(X_test)`
`accuracy = (y_pred == y_test).sum() / len(y_test)`
`print(accuracy)`
